

THE YELLOW COLOUR, and the illness

- Colour and health
- Carlos Aponte Sánchez-León

What happen in our eyes when they are YELLOW?

The membrane that covers our eyes has a white color in people, but in some cases a yellowish color appears.

This color appears if a substance that destroys the membrane, called bilirubin is deposited in the eyes.

This illness IS called JAUNDICE

WHAT IS THE BILIRUBIN?

Bilirubin is the waste of hemoglobin from the blood. It is a protein that carries oxygen through the liver to the intestine through the bile ducts. If an excess of bilirubin appears, produced by the body, it is when it is accumulates in the tissues

CAUSES OF THE BIRULUBIN:

- Bile duct problem
- Appearance of gallstones
- Medications that can inflame the liver.

Icterus TREATMENT:

There are two treatments for this ill, because it may have been formed in different ways:

- if the disease has been formed by the imbalance of liver functions, the problem is treated with psychology and natural remedies.
- and if the disease has been formed by some type of anemia, a correct and balanced diet should be carried out, containing adequate vitamins and nutrients to make the body begins to improve jaundice.
